

Confidential Project Brief

(A UK Jobs Insider initiative)

—

Overview

We're developing a **data-led platform for job seekers** that helps them understand, organise, and improve their job applications through intelligent tracking, insights, and automation.

The product will be incubated under **UK Jobs Insider (UKJI)** — a career platform with a **250,000+ strong community** — enabling immediate access to early adopters, pilots, and product validation.

This brief is intended for potential **technical cofounders or lead engineers** to understand the vision, build scope, and evaluation process.

—

Vision

To empower every job seeker with **data-driven clarity**, turning each job application into measurable insight — and eventually transforming job hunting into a fully optimised, automated system.

—

Core MVP Goals

The MVP will enable users to:

1. **Automatically capture** job details from their browser.
2. **View and track** all applications in one simple dashboard.
3. **Measure progress** against personal weekly or monthly targets.
4. **Receive feedback** based on performance and activity data.
5. **Ensure privacy-first capture**, with consent and encryption built-in.

—

Data Capture and Metrics

The platform will collect only **consent-based, anonymised data** from user activity to power personalised insights and benchmarking.

Primary Data Points Captured

1. **Time per Application** – How long each job application takes.
2. **Applications Sent** – Total jobs applied for daily, weekly, and monthly.
3. **Target Achievement** – Progress toward weekly or monthly application goals.
4. **CV Conversion Rate** – Percentage of applications that progress to a response or interview.
5. **Cold Emails Sent** – Number of outreach or networking emails sent.
6. **Cold Email Conversion Rate** – Response rates from cold outreach.
7. **Response Time from Employers** – Average employer reply time.
8. **Source Channel Performance** – Conversion rate by job board, referral, or company website.
9. **CV Version Effectiveness** – Track conversion rate by CV template or version.
10. **Application Timing Trends** – Identify days/times with higher success rates.
11. **Streak Tracking** – Consecutive active days or weeks to encourage momentum.

Privacy Principles

- 100% **user-consent-based tracking**.
- PII stored separately from behavioural metrics.
- Users can **export or delete** their data anytime.

—

Recommended Tech Stack

Frontend

- React + TypeScript + Tailwind CSS
- Chrome Extension SDK (Manifest V3)
- Charting via Recharts or Chart.js
- Next.js for optional SSR

Backend

- Node.js (TypeScript) or Python (FastAPI)

- PostgreSQL or Supabase
- Prisma ORM or SQLAlchemy
- AWS / GCP for scalable infrastructure

Integrations (Future)

- Gmail API for inbox tracking
- Stripe for billing
- Mixpanel / PostHog for analytics

Security

- GDPR-compliant data model
- Encryption for stored and transmitted data
- Role-based access + deletion control

Development Phases

Phase	Objective	Duration
Phase 1 — Core MVP	Browser extension + dashboard (manual tracking)	6–8 weeks
Phase 2 — Automation	Add automatic data capture and inbox sync	6–8 weeks
Phase 3 — Insights Layer	Introduce AI-driven feedback engine	8–12 weeks

Future Roadmap and Advanced Features

Beyond tracking and analytics, the product will evolve into a **job-hunting autopilot** — automating routine tasks while continuously learning from user data.

1. Automated Application Autofill

- Browser-based autofill that recognises job portals and pre-fills user data securely.
- Compatible with major sites (Indeed, TotalJobs, Reed, company portals).
- Data from autofill events used to improve accuracy and efficiency metrics.

2. LinkedIn “Easy Apply” Automation

- Automated LinkedIn Easy Apply submissions for pre-vetted roles.
- Triggers based on user preferences, skills, and historical data.
- Seamlessly integrates tracking and feedback from automated applications.

3. Smart CV Selector

- Machine learning model recommends the **best-performing CV version** per job type.
- Dynamically updates the active CV version used in autofill workflows.

4. Insight Engine 2.0

- Evolves from reactive analytics (“what went wrong”) to proactive guidance (“what to do next”).
- Contextual nudges like:
“Your CV v2 converts 25% better on analytics roles — prioritise it for the next 10 applications.”

5. Ecosystem Integrations

- Sync with Notion, Trello, and Google Calendar for holistic job tracking and interview reminders.

—

Your Evaluation Task

(Estimated effort: 4–5 hours)

Submit a **1-2 page technical and business brief** covering:

1. System Architecture

Describe the system structure — browser extension, backend, APIs, database, and dashboard flow.

2. Data Model

Outline the main entities (user, job entry, application event) and key fields per record.

3. KPI Logic

Explain how you would calculate and display 3–5 core metrics (e.g., application

count, conversion rate, average time per app).

4. Cost Estimate

Estimate **monthly operational cost per user**, including AWS/GCP hosting, database, and analytics.

5. Risks & Mitigations

Highlight two major technical challenges (e.g., Gmail API constraints, form capture reliability) and how you'd address them.

—

Submission Instructions

- Submit a **1-2 page PDF or Google Doc** with an optional **2-3 minute [Loom](#) walkthrough**.
- Deadline: **3 days** from receipt of this brief.
- Send via **Google Drive link or email** (vardaan@ukjobsinsider.com)
- Send along your GitHub / CV and that of any team that works with you on this.

—

Next Steps

Shortlisted candidates will be invited for:

1. A **technical deep dive** into their solution.
2. A **business alignment call** to discuss product vision, role, and equity structure.

—

Confidentiality Notice

This brief contains confidential and proprietary information. It must not be shared, reproduced, or discussed outside this evaluation process. Full product details will be disclosed only under NDA.
